

# Axial piston variable pump (A)A4VSO

**RA 92050-A/06.09 1/64**  
Replaces: 09.97

## Data sheet

Series 10, 11 and 30  
Size 40...1000  
Nominal pressure 5100 psi (350 bar)  
Peak pressure 5800 psi (400 bar)  
Open circuit

## Features

- Axial piston pump in swash plate design for hydrostatic drives in open circuit operation
  - The flow is proportional to the input drive speed and displacement. By adjusting the swash plate angle it is possible to infinitely vary the output flow.
  - Excellent suction characteristics
  - Low noise level
  - Long service life
  - Modular design
  - Short response times
  - Wide range of through drive options
  - Visual swivel angle indicator
  - Optional mounting position
  - Operation on HFC-fluids under reduced operational data possible
- A special version is available for operation with HFC-fluid see data sheet RA 92053
- For the descriptions of the control devices see the separate RA (RE) data sheets  
RA 92056, RA 92060, RA 92064,  
RE 92072, RA 92076, RA 92080, RE 92088

# Technical data

## Hydraulic fluid

For extensive information on the selection of hydraulic fluids and application conditions please consult our data sheets RA 90220 (mineral oils), RA 90221 (ecologically acceptable fluids) and RA 90223 (HF-fire resistant fluids).

The variable pump (A)A4VSO is suitable for operation on HF-fluids. (HFA, HFB, and HFC: EA4VSO or A4VSO....F  
HFD: standard version A4VSO with FKM seals)  
However, limitations to the technical data, according to RA 90223 must be observed.

**On certain selected HFC-fluids**, pump sizes **125...355**, executed in accordance to RA 92053 can be operated with the **same pressures and speeds** as on mineral oil.

On operation with HFA and HFB-fluids, limitations of the technical data must be observed according to RA 90223.

On operation with rolling oil (e.g. kerosene + additives) please consult us.

When ordering, please state the fluid to be used.

## Operating viscosity range

Within the operating viscosity range between 80...450 SUS (16...100 mm<sup>2</sup>/s) the units can be operated without limitations of the technical data.

In order to obtain optimum efficiency and service life, we recommend that the operating viscosity (at operating temperature) be selected in the range

$$v_{\text{opt}} = \text{opt. viscosity range } 80\ldots170 \text{ SUS (16}\ldots36 \text{ mm}^2/\text{s)}$$

referred to tank temperature (open circuit).

## Limit of viscosity range

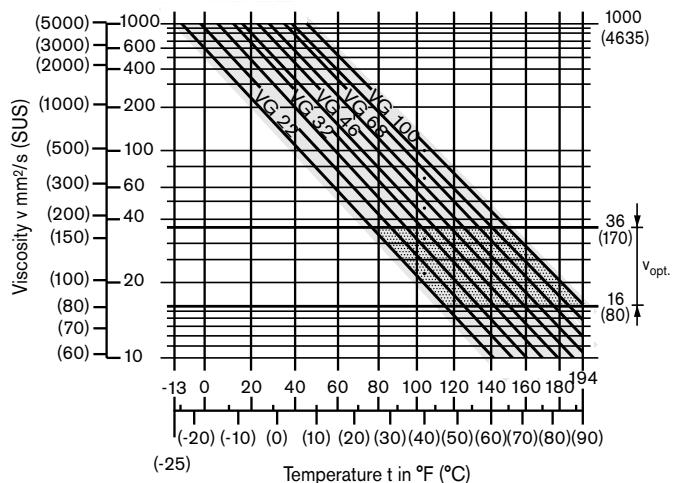

For critical operating conditions the following values apply:

$v_{\text{min}}$  = 60 SUS (10 mm<sup>2</sup>/s)  
for short periods ( $t < 3$  min)  
at max. permissible case drain temperature  
 $t_{\text{max}} = 194^\circ\text{F}$  (+90°C).

$v_{\text{max}}$  = 4550 SUS (1000 mm<sup>2</sup>/s)  
for short periods (on cold start, operating viscosity should be below 450 SUS (100 mm<sup>2</sup>/sec) within 15 minutes)  
 $t_{\text{min}} = -13^\circ\text{F}$  (-25°C)

For detailed information on operation with low temperatures see RA 90300-03-B.

## Selection diagram

## Notes on the selection of hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the tank (open circuit) in relation to the ambient temperature.

The hydraulic fluid should be selected so that within the operating temperature range, the viscosity lies within the optimum range ( $v_{\text{opt}}$ ); see shaded section in the selection diagram. We recommend, that the higher viscosity grade is selected in each case.

## Temperature range (see selection diagram)

$$\begin{aligned}t_{\text{min}} &= -13^\circ\text{F} (-25^\circ\text{C}) \\t_{\text{max}} &= 194^\circ\text{F} (+90^\circ\text{C})\end{aligned}$$

Example: at an ambient temperature of  $X^\circ\text{C}$  the operating temperature in the tank is  $140^\circ\text{F}$  ( $60^\circ\text{C}$ ). In the optimum viscosity range ( $v_{\text{opt}}$ ; shaded area), this corresponds to grades VG 46 or VG 68; select: VG 68.

**Important:** The case drain temperature is influenced by pressure and speed and is always higher than the tank temperature. However the max. temperature at any point in the system may not exceed  $194^\circ\text{F}$  ( $90^\circ\text{C}$ ).

# Technical data

## Bearing flushing

For the following operating conditions bearing flushing is required for a safe, continuous operation:

- Applications with special fluids (non mineral oils) due to limited lubricity and narrow operating temperature range
- Operation at critical conditions of temperature and viscosity with mineral oil

Flushing is recommended with vertical mounting (drive shaft facing upwards) in order to ensure lubrication of the front bearing and shaft seal.

Flushing is carried out via port „U“, located in the front flange area of the pump. The flushing fluid flows through the front bearing and leaves the pump together with the case drain flow.

Depending on pump size, the following flushing flows are recommended:

Size	40	71	125	180	250
recommended flushing flow $q_{sp}$ gpm (L/min)	0.8 (3)	1.0 (4)	1.3 (5)	1.8 (7)	2.6 (10)
Size	355	500	750	1000	
recommended flushing flow $q_{sp}$ gpm (L/min)	4.0 (15)	5.3 (20)	7.9 (30)	10.6 (40)	

These recommended flushing flows will cause a pressure drop of approx. 30 psi (2 bar) (series 1) and 45 psi (3 bar) (series 3) between the entrance to port „U“ and the pump case (including the pipe fittings).

## Notes regarding series 30

When using external bearing flushing the throttle screw at port U must be turned in to the end stop.

## Filtration of the fluid (Axial piston unit)

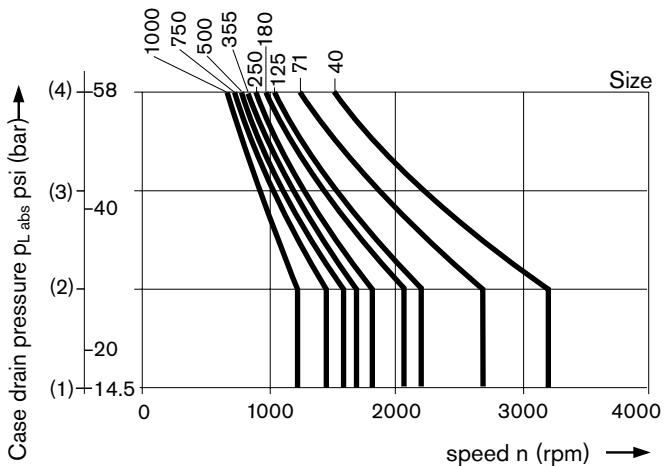

The finer the filtration, the better the achieved cleanliness of the fluid and the longer the life of the axial piston pump.

To ensure a reliable functioning of the axial piston unit, a minimum cleanliness class of

20/18/15 acc. to ISO 4406 is necessary.

## Case drain pressure

The permissible case drain pressure (housing pressure) is dependent on the drive speed (see diagram).

Max. case drain pressure (housing pressure)

$p_{L\ abs\ max}$  \_\_\_\_\_ 60 psi (4 bar) absolute

These are approximate values; under certain operating conditions a reduction in these values may be necessary.

# Technical data

## Operating pressure range

### Pressure at service line port (pressure port) B

**Nominal pressure**  $p_{\text{nom}}$  \_\_\_\_\_ 5100 psi (350 bar) absolute

**Peak pressure**  $p_{\text{max}}$  \_\_\_\_\_ 5800 psi (400 bar) absolute

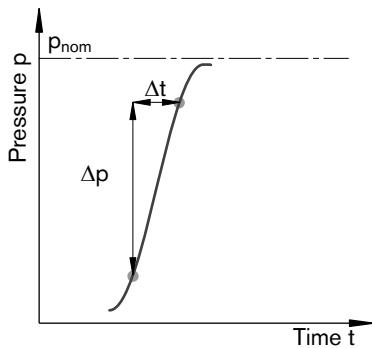

Total operating period \_\_\_\_\_ 300 h

Single operating period \_\_\_\_\_ 1 s

**Minimum pressure (high-pressure side)** \_\_\_\_\_ 215 psi (15 bar)

For lower pressures please consult us.

**Rate of pressure change  $R_A$**  \_\_\_\_\_ 232000 psi/s (16000 bar/s)

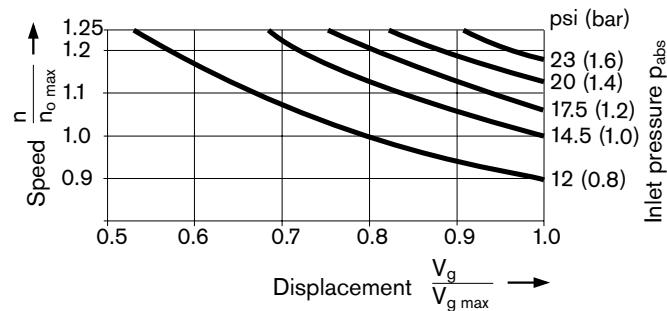

### Pressure at suction port S (inlet)

Minimum suction pressure  $p_S \text{ min}$  \_\_\_\_\_ 12 psi (0.8 bar) absolute

Maximum suction pressure  $p_S \text{ max}$  \_\_\_\_\_ 435 psi (30 bar) absolute

### Minimum pressure (inlet)

In order to avoid damage to the axial piston unit, a minimum pressure must be ensured at the suction port S (inlet). The minimum pressure is dependent on the speed and displacement of the axial piston unit.

The inlet pressure is the static feed pressure or the minimum dynamic value of the boost pressure.

Please note:

Max. permissible drive speed  $n_0 \text{ max. perm.}$  (speed limit) see page 8

Please contact us if these conditions cannot be satisfied.

## Definition

### Nominal pressure $p_{\text{nom}}$

The nominal pressure corresponds to the maximum design pressure.

### Peak pressure $p_{\text{max}}$

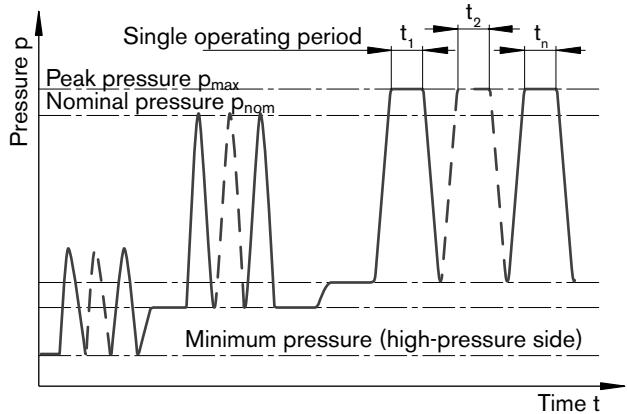

The peak pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

### Minimum pressure (high-pressure side)

Minimum pressure on the high-pressure side (B) that is required in order to prevent damage to the axial piston unit.

### Rate of pressure change $R_A$

Maximum permissible rate of pressure build-up and pressure reduction during a pressure change over the entire pressure range.

Total operating period =  $t_1 + t_2 + \dots + t_n$

<sup>1)</sup> High-Speed-Version

<sup>2)</sup> Values are valid with inlet pressure  $p_{abs} 14.5 \text{ psi (1 bar)}$  at inlet port S, with increased speed up to speed limit please observe diagram, page 7

<sup>3)</sup>  $V_g < V_g \text{ max}$

<sup>4)</sup> – The range of validity lies between zero and the maximum permissible drive speeds.

    Valid for external excitation (eg. diesel engine 2- to 8-fold rotary frequency, cardan shaft 2-fold rotary frequency).

    – The limiting value is only valid for a single pump.

    – The loading capacity of the connecting parts must be considered.

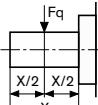

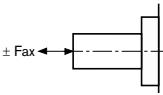

## Notes

Exceeding the maximum or falling below the minimum permissible values can lead to a loss of function, a reduction in operational service life or total destruction of the axial piston unit.

The permissible values can be determined through calculation.

## Technical data

### Permissible radial and axial forces on the drive shaft

Size		40	71	125	180	250	355	500	750*	1000	
Radial force, max.	 at $X/2$ $F_{q \max}$	lb (N)	225 (1000)	270 (1200)	360 (1600)	450 (2000)	450 (2000)	495 (2200)	560 (2500)	675 (3000)	786 (3500)

### Size 750

### Size 1000

—  $n = 1200 \text{ rpm}$

## Summary of controls

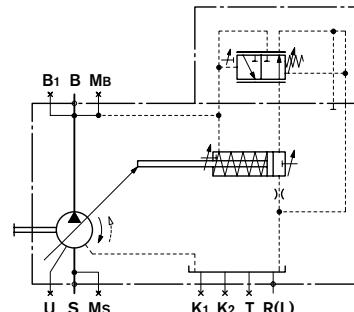

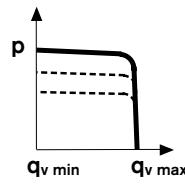

### Pressure control DR (see RA 92060)

The DR- pressure control limits the maximum pressure at the pump outlet within the pump's control range. This max. pressure level can be steplessly set at the control valve.

Setting range 725...5100 psi (50...350 bar)

Optional:

Remote control (DRG)

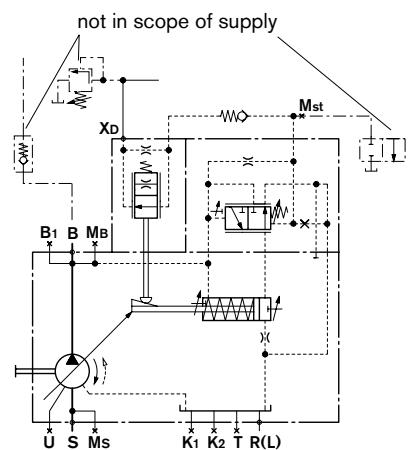

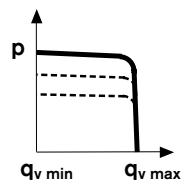

### Pressure control for parallel operation DP (see RA 92060)

Suitable for pressure control with multiple A4VSO axial piston pumps in parallel operation.

Optional:

Flow control (DPF)

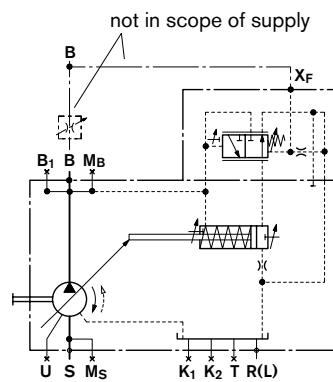

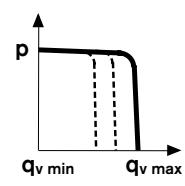

### Flow control FR (see RA 92060)

Maintains a constant flow in a hydraulic system.

Optional:

Remote pressure control (FRG)  
connection between  $X_F$  and tank closed  
(FR1, FRG1)

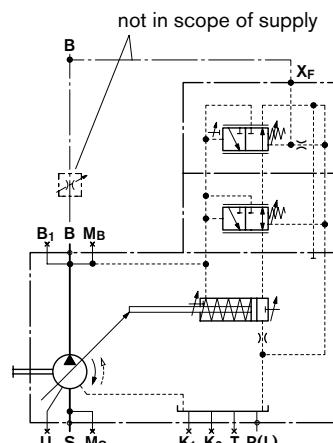

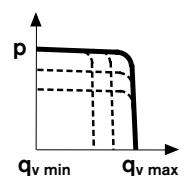

### Pressure and flow control DFR (see RA 92060)

This control maintains a constant flow from the pump even under varying operating conditions.  
Overriding this control is a mechanically adjustable pressure control.

Optional:

connection between  $X_F$  and tank closed (DFR1)

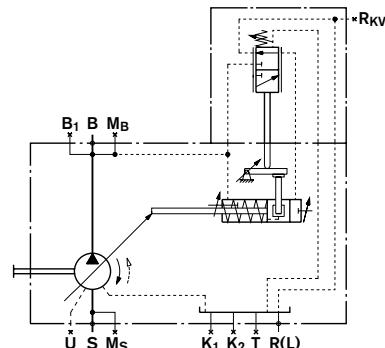

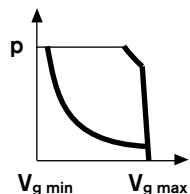

## Summary of controls

### Power control LR2 with hyperbolic characteristic (see RA 92064)

The hyperbolic power control maintains a constant preset drive power at the same input speed.

Optional:

- Pressure control (LR2D), remotely controlled (LR2G);
- Flow control (LR2F, LR2S);
- Hydraulic stroke limiter (LR2H);
- Mechanical stroke limiter (LR2M);
- Hydraulic two-point control (LR2Z);
- with electric unloading valve for easy start (LR2Y).

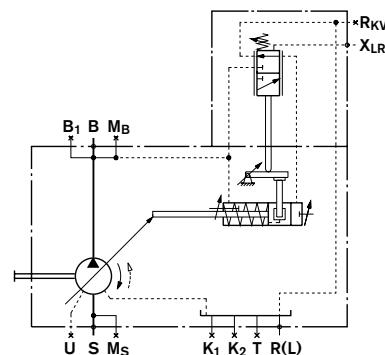

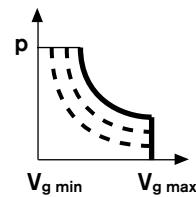

### Power control LR3 with remote control of power characteristics (see RA 92064)

This power control maintains a constant preset drive power, with remote control of the power characteristics.

Optional:

- Pressure control (LR3D), remotely controlled (LR3G);
- Flow control (LR3F, LR3S);
- Hydraulic stroke control (LR3H);
- Mechanical stroke control (LR3M);
- Hydraulic two-point control (LR3Z);
- with electric unloading valve for easy start (LR3Y)

### Hydraulic control LR2N and LR3N pilot pressure dependent, initial position $V_{g \min}$ (see RA 92064)

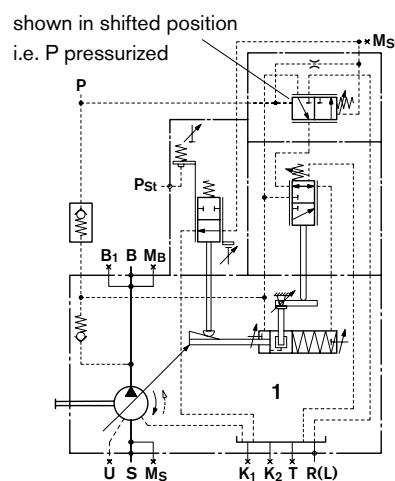

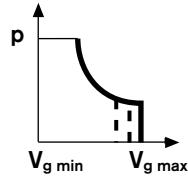

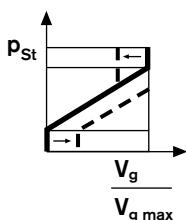

With overriding power control.

The pump displacement is proportional to a pilot pressure signal in  $P_{St}$ .

The additional hyperbolic power control overrides the pilot pressure signal and holds the preset drive power constant.

Optional:

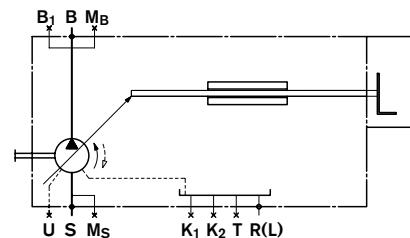

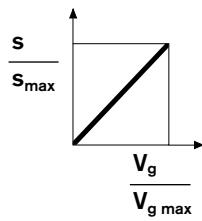

- Remote control of power characteristics (LR3N)
- Pressure control (LR.DN),
- Remote pressure control (LR.GN)
- Electric control of pilot pressure signal (LR.NT)

## Summary of controls

### Manual control MA (see RE 92072)

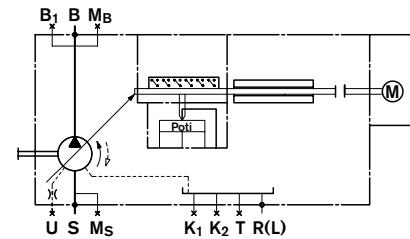

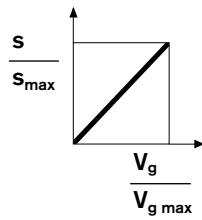

Stepless adjustment of displacement by means of a handwheel.

### Electric motor control EM (see RE 92072)

Stepless adjustment of displacement via an electric motor.

Various intermediate displacement values can be selected with a programmed sequence control, by means of built on limit switches and an optional potentiometer for feedback signal.

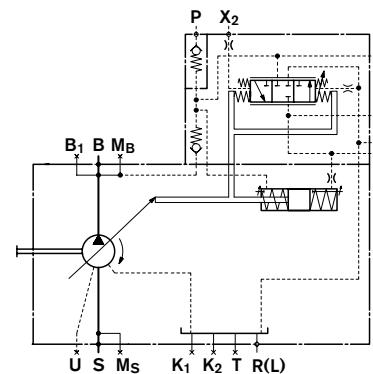

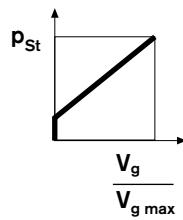

### Hydraulic control HD pilot pressure dependent (see RA 92080)

Stepless adjustment of displacement proportional to a pilot pressure signal. The displacement is proportional to the applied pilot pressure (Difference between pilot pressure level and pump case pressure).

Optional:

- Pilot pressure curves (HD1, HD2, HD3)
- Pressure control (HD.B),
- Remote pressure control (HD.GB)
- Power control (HD1P)
- with electric control of pilot pressure (HD1T)

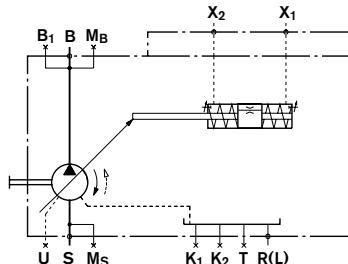

## Summary of controls

### Hydraulic control HM 1/2, control volume dependent (see RA 92076)

The pump displacement is infinitely variable in relation to the control oil volume in ports X<sub>1</sub> and X<sub>2</sub>.

Application:

- 2-point control
- basic control device for servo or proportional valve control

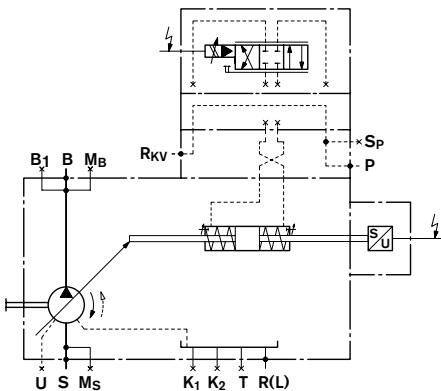

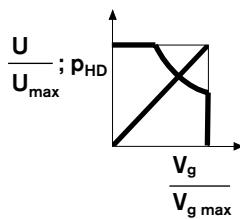

### Control system HS, HS4, with servo or proportional valve (see RA 92076)

The stepless displacement control is accomplished by means of servo or proportional valve with electrical feedback of the swivel angle.

The HS4P-control system is fitted with a built on pressure transducer so that it can be utilized for electrical pressure and power control.

Optional:

- Servo valve (HS);
- Proportional valve (HS4);
- Short circuit valve (HSK, HS4K, HS4KP);
- Without valves (HSE, HS4E).
- For oil-immersed use (HS4M)

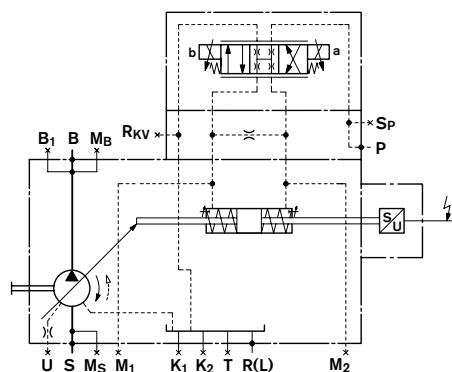

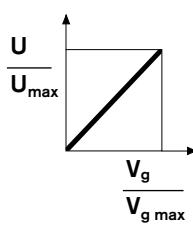

### Control system EO1/2 (see RA 92076)

The stepless adjustment of the displacement is accomplished by means of a proportional valve with electrical feedback of the swivel angle.

This control can be utilized as an electric control of displacement.

Optional:

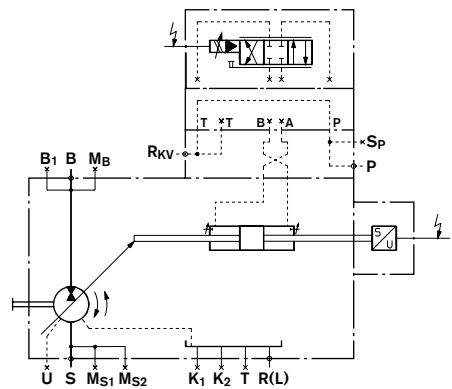

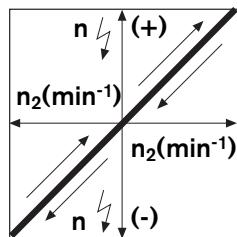

- Control pressure range (EO1, EO2)
- Short circuit valve (EO1K, EO2K)
- Without valves (EO1E, EO2E)

## Summary of controls

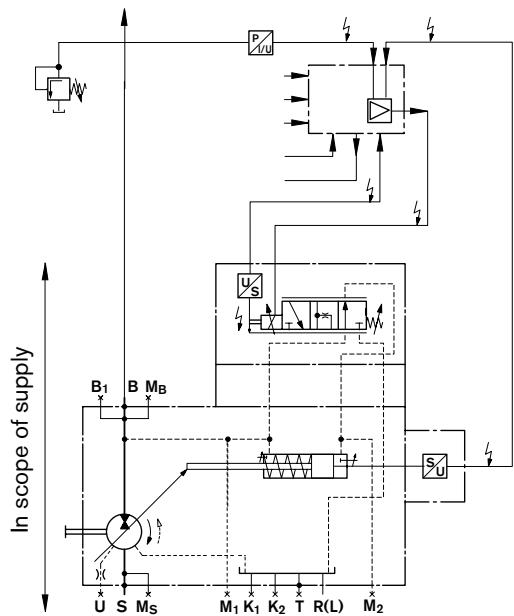

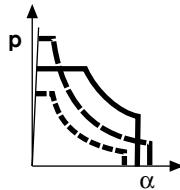

### Speed control DS1, secundary controlled (see RE 92056)

The speed control DS1 controls the secundary unit (motor) in such a manner, that this motor delivers sufficient torque to maintain the required output speed. When connected to a constant pressure system, this torque is proportional to motor displacement and thus also proportional to the swivel angle.

### Electro hydraulic control system DFE1 (see RE 92088)

The power, pressure and swivel angle control of the variable pump A4VSO...DFE1 is accomplished by means of an electrically controlled proportional valve. A current signal to the proportional valve moves the control piston and determines via an integrated positional transducer the cradle's swivel angle and thus the pump flow. When the electric drive motor is switched off and the system is pressureless, the bias spring in the control chamber will swivel the pump to max. displacement ( $V_{g \max}$ ).

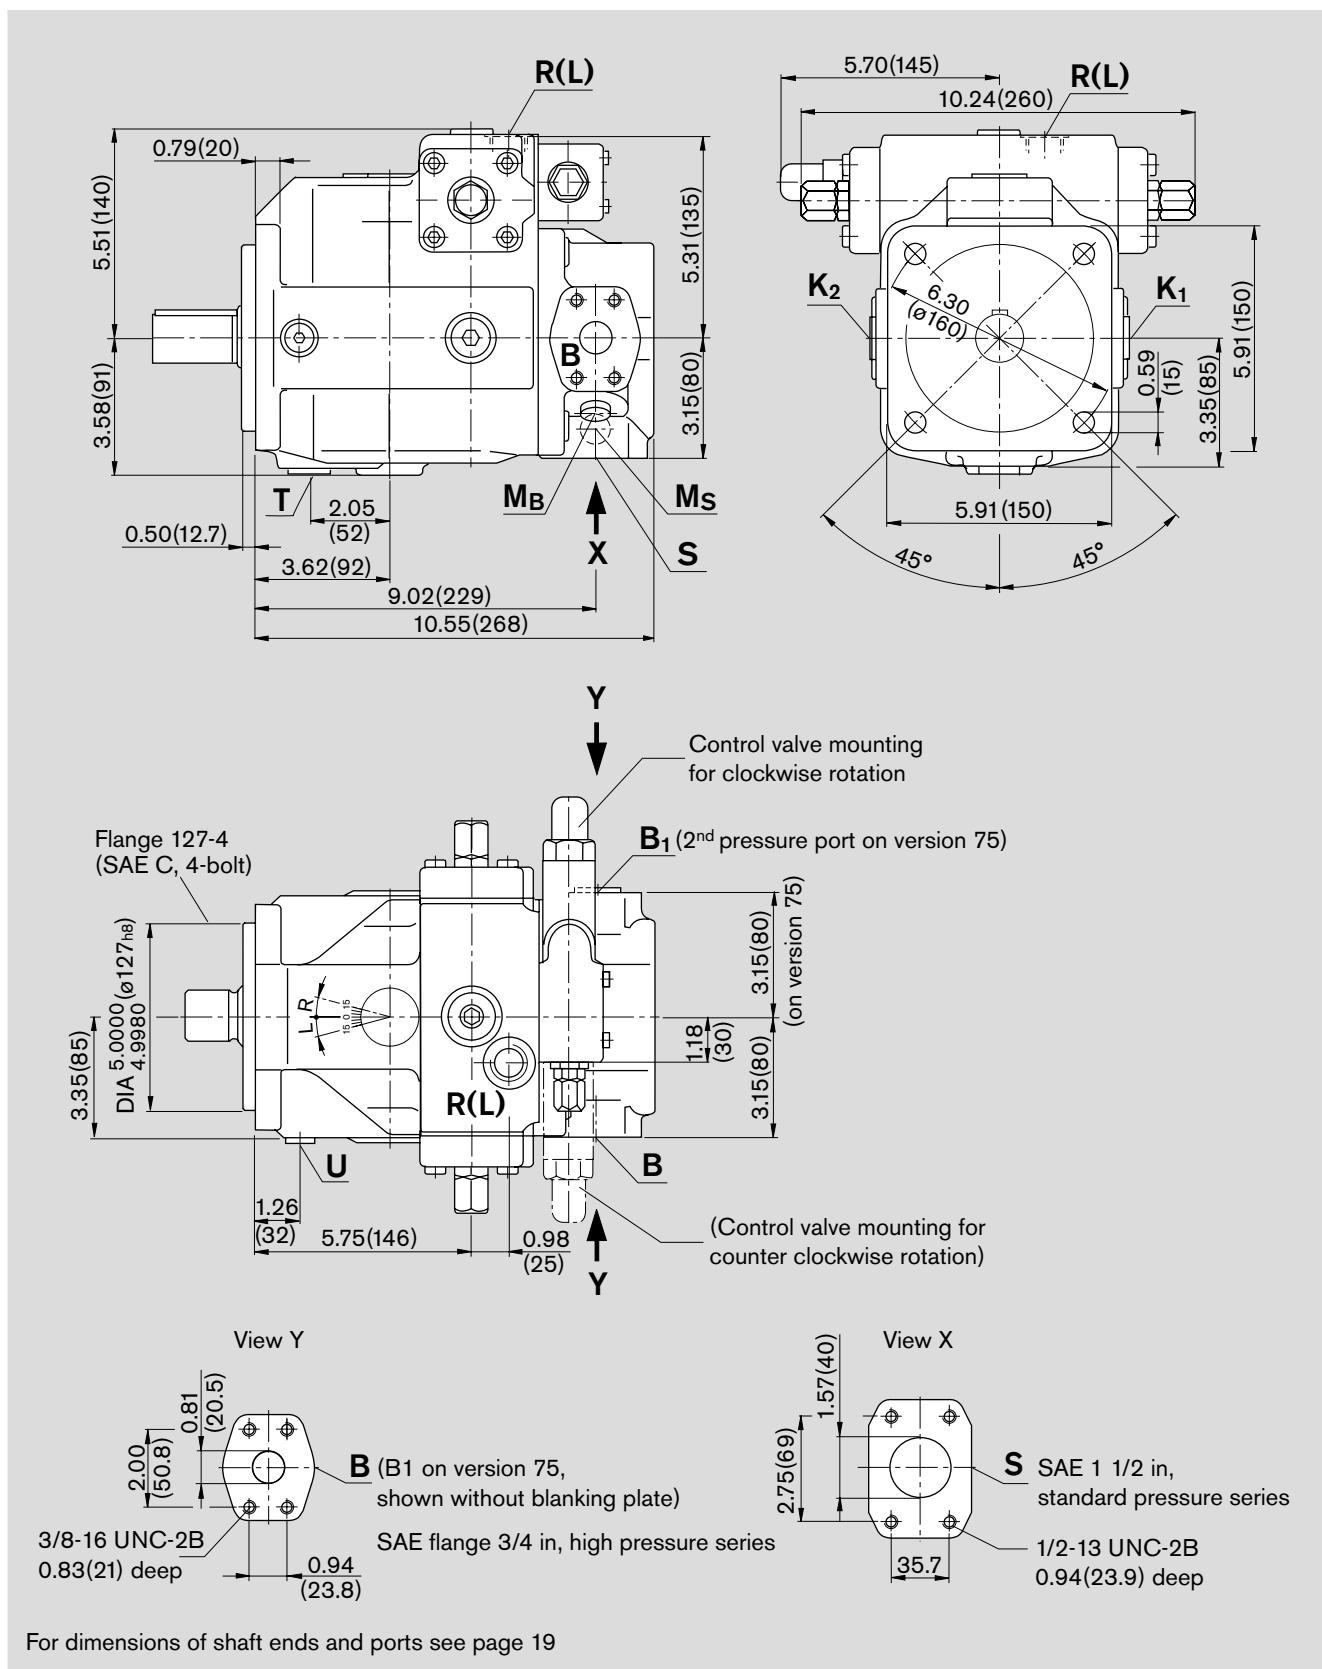

# Dimensions, size 40

## Through drive

The axial piston unit (A)AA4VSO can be equipped with a through drive, as shown in the type code on page 4.

The through drive execution is designated by the code K/U 15...99.

We recommend, that no more than three pumps be coupled together.

### Permissible input and through drive torques

Size	40	71	125	180	250	355	500	750	1000		
<b>Splined shaft</b>											
Max. perm. total input torque at shaft of pump 1											
(Pump 1 + pump 2)	$T_{tot\ max}$	lb-ft Nm	329 (446)	583 (790)	1027 (1392)	1478 (2004)	2052 (2782)	2133 (2890)	4105 (5566)	6157 (8348)	8209 (11130)
A Perm. through drive torque	$T_{D1\ max}$	lb-ft Nm	164 (223)	291 (395)	513 (696)	739 (1002)	1026 (1391)	1457 (1976)	2052 (2783)	3078 (4174)	4104 (5565)
B Perm. through drive torque	$T_{D2\ max}$	lb-ft Nm	164 (223)	291 (395)	513 (696)	739 (1002)	1026 (1391)	675 (914)	2052 (2783)	3078 (4174)	4104 (5565)
<b>Keyed shaft</b>											
Max. perm. total input torque at shaft of pump 1											
(Pump 1 + pump 2)	$T_{tot\ max}$	lb-ft Nm	329 (446)	583 (790)	1027 (1392)	1479 (2004)	1889 (2560)	2917 (3952)	3835 (5200)	5541 (7513)	6965 (9444)
A Perm. through drive torque	$T_{D1\ max}$	lb-ft Nm	164 (223)	291 (395)	513 (696)	739 (1002)	1026 (1391)	1457 (1976)	2052 (2783)	3078 (4174)	4104 (5565)
B Perm. through drive torque	$T_{D2\ max}$	lb-ft Nm	164 (223)	291 (395)	513 (696)	739 (1002)	863 (1169)	1457 (1976)	1783 (2417)	2463 (3339)	2860 (3879)

### Distribution of torques

### Single pump with through drive

If no further pumps are factory-mounted the simple type code is sufficient.

#### included in this case are:

on all through drives except K/U 99

shaft coupler, mounting screws, seal and if required an adapter flange

on K/U 99

with through drive shaft, without shaft coupler, without adapter flange; unit is closed with pressure tight cover.

#### Universal through drive

On pump sizes 125...355 all through drives are supplied as universal through drives „U“.

These have the advantage, that they can be adapted later on.

Simply by exchanging the adapter flange and the shaft coupler it is possible to convert the through drive option.

The conversion sets must be ordered separately, see RE 95581.

### Combination pumps

Independent circuits are available for the user when further pumps are built on.

1. If the combination consists of **2 Rexroth axial piston pumps**, and if this must be **factory mounted**, the two individual type codes must be joined by a „+“.

Ordering example:

AA4VSO 125 DR / 30 R – PSD75U16 + AA4VSO 71 DR / 10 R – PSD63N00

- 2 If a **gear** or a radial piston pump must be **factory mounted** as the second pump please consult us.

355	2.53(64)	1.34(34)	3.394 <sup>+0.006</sup> (86.2 <sup>+0.15</sup> )	W42x1.25x32x9g	160 x 2

<sup>1)</sup> Thread to DIN 13, for the max. tightening torques observe the general information on page 64

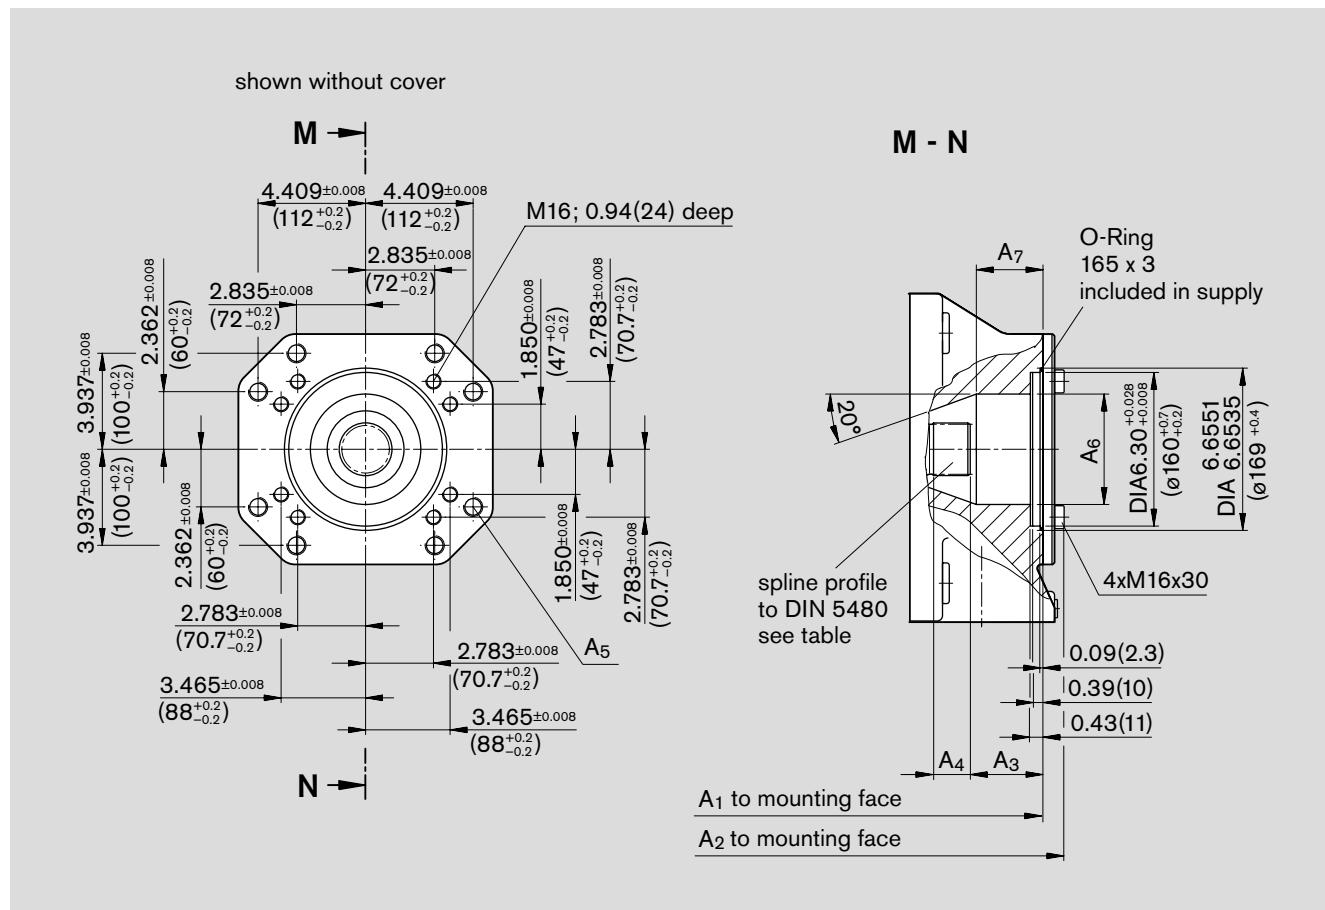

Sizes 500...1000 see page 62

# Dimensions through drives

Before finalising your design please request a certified installation drawing. Dimensions in inches (mm).

## K99 Sizes 500...1000

with through drive shaft, without shaft coupler, without adapter flange, closed with pressure tight cover

Size Main pump	A <sub>1</sub>	A <sub>2</sub>	A <sub>3</sub>	A <sub>4</sub>	A <sub>5</sub> <sup>1)</sup>	A <sub>6</sub>	A <sub>7</sub>
500	19.88(505)	20.75(527)	2.87(73)	1.61(41)	M20; 0.94(24) deep	Dia4.53( $\varnothing 115$ )	2.95(75)
750	21.85(555)	22.72(577)	2.87(73)	1.61(41)	M20; 0.94(24) deep	Dia4.53( $\varnothing 115$ )	2.95(75)
750*	in preparation						
1000	24.72(628)	25.59(650)	3.03(77)	2.62(66.5)	M20; 1.18(30) deep	Dia5.43( $\varnothing 138$ )	2.56(65)

Size Main pump	Spline profile to DIN 5480
500	W55x1,25x42x9g
750	W55x1,25x42x9g
750*	in preparation
1000	W65x1,25x50x9g

\* with boost pump

<sup>1)</sup> Thread to DIN 13, for the max. tightening torques observe the general information on page 64

Sizes 40 and 71 see page 60 and sizes 125...355 see page 61

# Installation notes

## Mounting position:

Optional. The pump case must be filled with fluid during commissioning and remain full when operating.  
In order to reduce the operating noise level, all connecting lines (suction, pressure and case drain lines) must be de-coupled from the tank, using flexible elements.  
The use of check valves in the case drain line must be avoided. The case drain line must be returned directly to tank without a reduction in cross section.  
Exceptions maybe possible, please consult us first.

### 1. Vertical installation (shaft end pointing upwards)

With a vertical installation, bearing flushing is recommended to provide lubrication for the front bearing, see page 6.

The following installation conditions must be taken into account:

#### 1.1 Installation into the reservoir

a) When the minimum fluid level is equal to or above the pump mounting flange area: ports »R/L«, »T« and »S« open (see fig. 1).

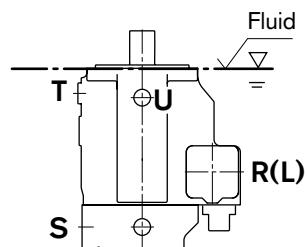

Fig. 1

b) When the minimum fluid level is below the mounting flange area: ports »R/L«, »T« und possibly »S« must be piped as shown in fig. 2. Also observe the conditions as shown in point 1.2.

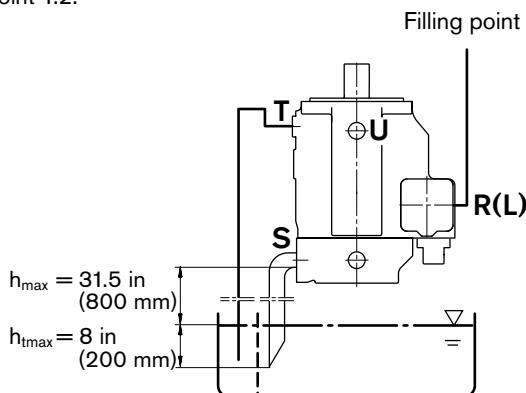

Fig. 2

#### 1.2 Installation outside the reservoir

Before installation, fill the pump housing with the pump in a horizontal position.

Pipe port »T« to tank, »R/L« plugged.

Filling in mounted condition: fill via »R« and bleed via »T«, afterwards plug port »R«.

**Conditions:** A minimum pump inlet pressure (suction pressure) of 12 psi (0,8 bar) abs. is necessary. Avoid mounting above the reservoir in order to reduce the noise level.

## 2. Horizontal installation

The highest situated of the ports »T«, »K<sub>1</sub>«, »K<sub>2</sub>« or »R/L« must be used for filling/bleeding and subsequently to connect the case drain line.

### 2.1 Installation inside the reservoir

a) When the minimum fluid level is equal to or lies above the upper edge of the pump: case drain port and suction port »S« open (see fig. 3).

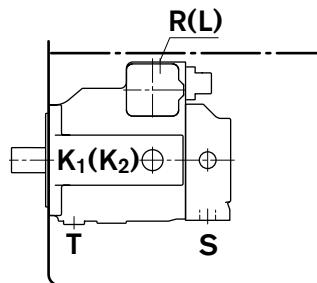

Fig. 3

b) When the minimum fluid level lies below the upper edge of the pump: case drain port and possibly port »S« must be piped, see fig. 4. Observe conditions as shown in point 1.2.

Fill pump housing prior to commissioning.

### 2.2 Installation outside the reservoir

Fill the pump housing before commissioning.

a) Mounting above the reservoir see fig. 4.

Observe conditions as shown in point 1.2.

b) Mounting below the reservoir

Case drain port and port »S« must be piped (see fig. 5).

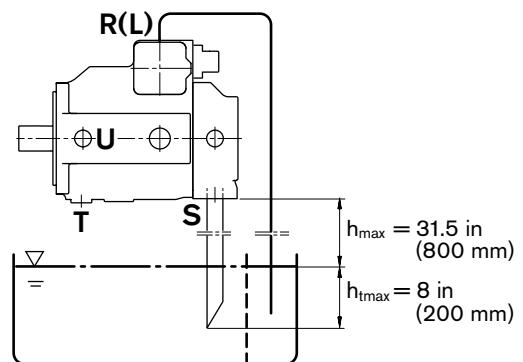

Fig. 4

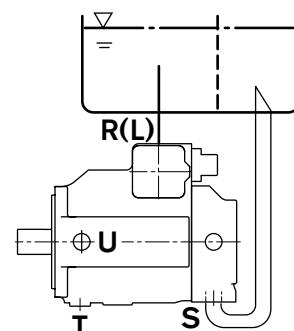

Fig. 5

## General information

- The pump( A)A4VSO was designed for operation in open loop circuits.
- Systems design, installation and commissioning requires trained technicians or tradesmen.
- All hydraulic ports can only be used for the fastening of hydraulic service lines.
- Tightening torques:
  - All tightening torques mentioned in this data sheet are maximum values and may not be exceeded (Maximum values for the female threads in the castings). Please comply with the manufacturer's information regarding the max. permissible tightening torques for the used fittings.
  - For fastening screws to ISO 68 / DIN 13 we recommend to check the permissible tightening torque in each individual case acc. to VDI 2230 issue 2003.
- During and shortly after operation of a pump the housing and especially a solenoid can be extremely hot. Take suitable safety measures (e.g. wear protective clothing).
- All given data and information has to be adhered to.
